Models of Radar Cross Sections for Satellites

Spherical Harmonics Expansion

$$f(\theta, \phi) \approx a_{0,0}Y_0^0 + a_{1,-1}Y_1^{-1} \\ + a_{1,0}Y_1^0 + a_{1,1}Y_1^1 + \dots$$

where

$$Y_n^m(\theta, \phi) = \sqrt{\frac{(2n+1)(n-m)!}{4\pi(n+m)!}} P_n^m(\cos \theta) e^{im\phi}$$

Overview

- 1 Radar Cross Section Simulation
- 2 Preparing for Mercury MoM
- 3 Custom Software Tools
- 4 Backup Slides

Input and Final Output

Input: *.obj File

```
1  # Created with the Wolfram
    Language : www.
    wolfram.com
2
3  mtl lib sp-006.mtl
4
5  # 6 vertex positions
6  v  0 0 -1
7  v  0 -1 0
8  v  -1 0 0
9  v  1 0 0
10 v  0 0 1
11 v  0 1 0
```

Output: Amplitude Vector

$$\begin{aligned}a_{0,0} &= 1.345 \pm 0.015 \\a_{1,-1} &= 1.098 \pm 0.017 \\a_{1,0} &= 1.210 \pm 0.017 \\a_{1,1} &= 0.945 \pm 0.017 \\a_{2,-2} &= 0.512 \pm 0.018 \\a_{2,-1} &= 0.732 \pm 0.017 \\a_{2,0} &= 1.110 \pm 0.017 \\a_{2,1} &= 0.885 \pm 0.016 \\a_{2,2} &= 0.658 \pm 0.017\end{aligned}$$

Beginning to End I

Data Creation and Analysis Steps

- ① Start with CAD model: *.stl
- ② Create *.obj (all facets, vertices)
- ③ Create *.facet (partitioned by materials)
 - Create *.geo (geometry)
 - Create *.lib (EM properties)
- ④ Run Mercury MoM
- ⑤ Generate *.4112.txt
- ⑥ Harvest θ, ϕ fields

Beginning to End II

- 7 Create `*.rcs`
- 8 Create amplitudes a

Big Picture: CAD to *.geo

Preparing to Run Mercury MoM

- 1 Start with CAD model: *.stl
- 2 Finish with table *.geo
- 3 Partition CAD material by materials properties

Biggest Challenge

Going from a CAD model to a model of **different electromagnetic materials**.

Software Components

- ① converter: *.obj \Rightarrow *.facet
- ② mesh analysis & repair: *.obj \Rightarrow *.facet
- ③ extractor: pull backscatter from *.4112.txt
- ④ converter: backscatter to *.rcs
- ⑤ calculator: *.rcs to spherical harmonic amplitudes

CAD file (*.stl) to Mesh Structure File (*.obj)

Many Tools For Converting *.stl to *.obj

- 1 Blender
- 2 FreeCAD
- 3 OpenSCAD
- 4 SolidWorks
- 5 Tinkercad
- 6 MeshConvert.com
- 7 Online 3D Model Converter
- 8 others

Seeing the *.obj File

6 vertices

60 vertices

600 vertices

Decadal Improvement in Resolution:
Number of vertices increases $\times 10$

sp-006.obj

```
1  # Created with the
    Wolfram Language :
    www.wolfram.com
2
3  mtl lib sp-006.mtl
4
5  # 6 vertex positions
6  v  0 0 -1
7  v  0 -1 0
8  v  -1 0 0
9  v  1 0 0
10 v  0 0 1
11 v  0 1 0
12
13 # 0 UV coordinates
14
15 # 0 vertex normals
```

```
17 # Mesh '' with 8 faces
18 usemtl Material_1
19 f  1/ 2/ 3/
20 f  2/ 1/ 4/
21 f  2/ 5/ 3/
22 f  5/ 2/ 4/
23 f  1/ 6/ 4/
24 f  6/ 1/ 3/
25 f  6/ 5/ 4/
26 f  5/ 6/ 3/
```

Components of the *.obj

1 Headers and Comments (#):

- Used for metadata or human-readable information.
- Example: # Created with Wolfram Language.

2 Vertex Positions (v):

- Specifies 3D coordinates for vertices.
- Example: v 0 0 -1.

3 Faces (f):

- Defines polygons by referencing vertex indices.
- Example: f 1/2/3.

Components of the *.obj

④ Material Library Reference (mtllib):

- External *.mtl file that specifies **visual materials** for rendering (e.g., color, shading)
- Example: sp-006.mtl.
- Important Note: This *.mtl file is **not related** to the **electromagnetic materials** library in CAD models, which defines physical properties like permittivity, permeability, or conductivity.

Facet (Face)

- Discretized as small triangular or quadrilateral elements.
- Supports surface currents (\vec{J}) induced by incident fields.
- Enforces boundary conditions derived from Maxwell's equations:
 - PEC: $\vec{E}_t = \vec{0}$
 - Dielectric: $\vec{E}_t^{(1)} = \vec{E}_t^{(2)}, \quad \vec{H}_t^{(1)} - \vec{H}_t^{(2)} = \vec{K}$
- Surface currents are discretized using basis functions (e.g., RWG).
- Integral equations relate \vec{J} to scattered fields via Green's functions.

Edges

- Shared boundaries between adjacent facets.
- Enforces physical continuity of surface current, \vec{J} .
- Charge conservation at the edge:

$$\nabla_s \cdot \vec{J} = -j\omega\rho \quad (4.1)$$

where ρ is the surface charge density.

- Used in testing (e.g., Galerkin's method) to evaluate interaction integrals.

Boundary Conditions

- Maxwell's boundary conditions on facets:

$$\text{PEC: } \vec{E}_t = \vec{0}$$

$$\text{Dielectric: } \vec{E}_t^{(1)} = \vec{E}_t^{(2)}$$
$$\vec{H}_t^{(1)} - \vec{H}_t^{(2)} = \vec{K}$$

- Continuity enforced on edges:

$$\vec{J}_{\text{facet } 1} \cdot \hat{n}_{\text{edge}} = \vec{J}_{\text{facet } 2} \cdot \hat{n}_{\text{edge}}$$

- Ensures no spurious currents or charge accumulation.

Interplay Between Face and Edge

- **Facet:** Supports surface currents \vec{J} and tangential electric field \vec{E}_t .
- **Edge:** Ensures:
 - Continuity of \vec{J} across facets.
 - Charge conservation, (4.1):
- Maxwell's equations are satisfied numerically:

$$\nabla \times \vec{H} = \vec{J} + j\omega\epsilon\vec{E}$$

$$\nabla \cdot \vec{E} = \frac{\rho}{\epsilon}$$

RWG Basis Functions – Overview

- Used to represent surface currents (\vec{J}) in MoM simulations.
- Defined on pairs of adjacent triangular elements sharing an edge.
- Ensures:
 - Continuity of surface current across shared edges.
 - Sparse and efficient numerical representation.
- Piecewise linear variation within triangles.

RWG Basis Function Definition

- For two adjacent triangles T^+ and T^- sharing edge l_n :
- RWG function $\vec{f}_n(\vec{r})$:

$$\vec{f}_n(\vec{r}) = \begin{cases} \frac{l_n}{2A^+}(\vec{r} - \vec{r}_+), & \vec{r} \in T^+ \\ \frac{l_n}{2A^-}(\vec{r}_- - \vec{r}), & \vec{r} \in T^- \\ 0, & \text{otherwise} \end{cases} \quad (1)$$

- **Parameters:**
 - l_n : Length of the shared edge.
 - A^+ , A^- : Areas of triangles T^+ and T^- .
 - \vec{r}_+ , \vec{r}_- : Opposite vertices in T^+ , T^- relative to l_n .

Surface Current Representation

- Total surface current density $\vec{J}(\vec{r})$:

$$\vec{J}(\vec{r}) = \sum_n I_n \vec{f}_n(\vec{r}) \quad (4.2)$$

- I_n : Coefficients representing the current magnitude for basis function n .
- RWG basis functions provide local support, simplifying matrix assembly.

Matrix Assembly in MoM

- Integral form of Maxwell's equations discretized using RWG functions.
- Resulting system of equations:

$$\mathbf{Z}\mathbf{I} = \mathbf{V} \quad (4.3)$$

- Terms:
 - **Z**: Impedance matrix from basis function interactions.
 - **I**: Vector of current coefficients (I_n).
 - **V**: Excitation vector from incident fields.

Key Properties of RWG

- **Continuity:**

$$\vec{J}_{\text{facet } 1} \cdot \hat{n}_{\text{edge}} = \vec{J}_{\text{facet } 2} \cdot \hat{n}_{\text{edge}} \quad (4)$$

Ensures smooth current flow across edges.

- **Sparse Representation:**

- Non-zero support only on two triangles sharing an edge.

- **Accuracy:**

- Captures linear current variations.
- Suitable for arbitrary geometries.

Summary of RWG Functions

- Represent surface currents in MoM using triangular mesh discretization.
- Defined on pairs of adjacent triangles sharing a common edge.
- Ensure:
 - Continuity of surface currents across edges.
 - Sparse, efficient representation of \vec{J} .
- **Efficient matrix assembly** in MoM simulations.

Impedance Matrix

- Each element Z_{mn} evaluates interaction between basis functions:

$$Z_{mn} = \iint \vec{f}_m(\vec{r}) \cdot \vec{G}(\vec{r}, \vec{r}') \cdot \vec{f}_n(\vec{r}') dS dS' \quad (2)$$

- Terms:
 - $\vec{f}_m(\vec{r})$: RWG basis functions.
 - $\vec{G}(\vec{r}, \vec{r}')$: Green's function coupling source and observation points.
- Dense matrix, costly to compute and store.

Impedance Matrix

- Each element Z_{mn} evaluates interaction between basis functions:

$$Z_{mn} = \iint \vec{f}_m(\vec{r}) \cdot \vec{G}(\vec{r}, \vec{r}') \cdot \vec{f}_n(\vec{r}') dS dS' \quad (2)$$

- Terms:
 - $\vec{f}_m(\vec{r})$: RWG basis functions.
 - $\vec{G}(\vec{r}, \vec{r}')$: Green's function coupling source and observation points.
- Dense matrix, costly to compute and store.

Excitation Vector

- Represents contribution of incident fields:

$$V_m = \iint \vec{f}_m(\vec{r}) \cdot \vec{E}_{\text{inc}}(\vec{r}) \, dS \quad (3)$$

- **Terms:**
 - $\vec{E}_{\text{inc}}(\vec{r})$: Incident electric field.
 - $\vec{f}_m(\vec{r})$: RWG basis function.

Physical and Numerical Behavior

- **Surfaces Reflect:**
 - Represent scattering and reflection of electromagnetic waves.
 - Surface currents (\vec{J}) induced by incident fields.
- **Edges Ring:**
 - Enforce continuity of surface currents across facets.
 - Numerical challenges can cause spurious oscillations.
 - Proper charge conservation ensures stable edge behavior.

Challenges in Solving the System

- **Z is dense:**
 - High memory requirement ($O(N^2)$).
 - Computationally expensive for direct solvers ($O(N^3)$).
- Ill-conditioning may require preconditioning.

Solution Techniques

- **Direct Solvers:**
 - Gaussian elimination or LU decomposition.
 - Cost: $O(N^3)$.
- **Iterative Solvers:**
 - Conjugate Gradient (CG), GMRES.
 - Cost per iteration: $O(N^2)$.
 - Requires preconditioning for convergence.
- **Fast Multipole Method (FMM):**
 - Reduces complexity to $O(N \log N)$.
 - Approximates far-field interactions.

Summary of Linear System and Solutions

- **Linear system:**

$$\mathbf{Z}\mathbf{I} = \mathbf{V} \quad (1)$$

- **Key challenges:**

- Dense, large-scale matrix \mathbf{Z} .
- Computational cost of direct solvers.

- **Efficient techniques:**

- Iterative solvers for large systems.
- FMM for reducing complexity.
